

**Specific inactivated yeast based formulation, rich in immobilized copper
to treat sulfur off-aromas and reduction problems**

OENOLOGICAL USE

EXELIES RED'EX allows to decrease sulfur off-aromas without the risk of oxidation or loss of fruitiness. The polysaccharids yielded by the formulation improve the volume and roundness in mouth.

EXELIES RED'EX is a curative treatment and will be used only once the defect detected (at the end of fermentation or MLF for example). It is recommended with little dosages in whites and more often used on red and rosé wines.

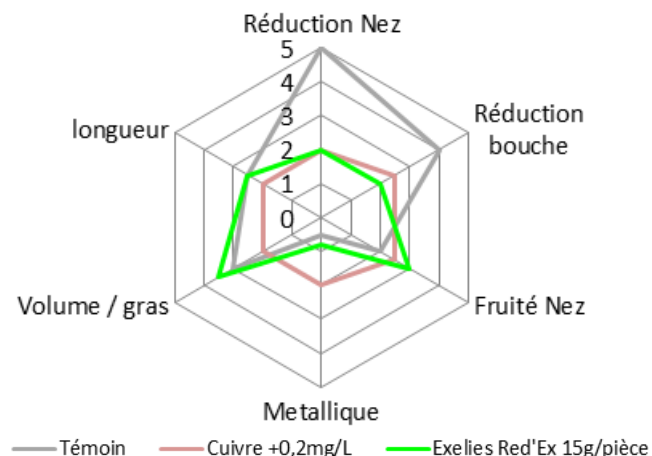

PROTOCOL FOR USE

Dissolve EXELIES RED'EX in 4 to 5 times its weight of water. Add to the wine during a non-oxidative pump-over.

We recommend to taste the wine once treated every days, to judge the stopping or continuation of treatment. If necessary, we resuspend the product (a few minutes of mixing) and a new tasting is done the next day.

Good results are obtained after 1 to 6 days after treatment: settle the wine without any SO₂.
